Abstract

Fault tolerance is a major concern to guarantee availability and reliability of critical services as well as application execution. In order to minimize failure impact on the system and application execution, failures should be anticipated and proactively handled. Fault tolerance techniques are used to predict these failures and take an appropriate action before failures actually occur. This paper discusses the existing fault tolerance techniques in cloud computing based on their policies, tools used and research challenges. Cloud virtualized system architecture has been proposed. In the proposed system autonomic fault tolerance has been implemented. The experimental results demonstrate that the proposed system can deal with various software faults for server applications in a cloud virtualized environment.

Keywords: *Cloud Computing; Virtual Machine; Fault Tolerance; Replication*

1. Introduction

Cloud computing is a style of computing where service is provided across the Internet using different models and layers of abstraction [4]. It refers to the applications delivered as services [5] to the mass, ranging from the end-users hosting their personal documents on the Internet to enterprises outsourcing their entire IT infrastructure to external data centers. A simple example of cloud computing service is Yahoo email or Gmail etc.

Although cloud computing has been widely adopted by the industry, still there are many research issues to be fully addressed like fault tolerance, workflow scheduling, workflow management, security etc. Fault tolerance is one of the key issues amongst all. It is concerned with all the techniques necessary to enable a system to tolerate software faults remaining in the system after its development. When a fault occurs,

these techniques provide mechanisms to the software system to prevent system failure occurrence [18]. The main benefits of implementing fault tolerance in cloud computing include failure recovery, lower cost, improved performance metrics etc. This paper aims to provide a better understanding of fault tolerance challenges and identifies various tools and techniques used for fault tolerance. When multiple instances of an application are running on several virtual machines and one of the server goes down, there is a need to implement an autonomic fault tolerance technique that can handle these types of faults. To address this issue, cloud virtualized system architecture has been proposed and implemented using HAProxy. The proposed architecture also has been validated through experimental results.

The rest of the paper is organized as follows. Section 2 discusses fault tolerance techniques based on their policies. Section 3 presents challenges of implementing fault tolerance in cloud computing. Section 4 identifies the comparison between various tools used for implementing fault tolerance techniques with their comparison table. Section 5 presents proposed cloud virtualized architecture and implementation with experimental results. Section 6 finally concludes the paper.

2. Background

There are various faults which can occur in cloud computing. Based on fault tolerance policies various fault tolerance techniques can be used that can either be task level or workflow level.

2.1 Reactive fault tolerance

Reactive fault tolerance policies reduce the effect of failures on application execution when the failure effectively occurs. There are various techniques

which are based on these policies like Checkpoint/Restart, Replay and Retry and so on.

- Check pointing/ Restart - When a task fails, it is allowed to be restarted from the recently checked pointed state rather than from the beginning. It is an efficient task level fault tolerance technique for long running applications [2].
- Replication-Variou s task replicas are run on different resources, for the execution to succeed till the entire replicated task is not crashed. It can be implemented using tools like HAProxy, Hadoop and AmazonEc2 etc.
- Job Migration-During failure of any task, it can be migrated to another machine. This technique can be implemented by using HAProxy.
- SGuard- It is less disruptive to normal stream processing and makes more resources available. SGuard is based on rollback recovery [18] and can be implemented in HADOOP, Amazon EC2.
- Retry-It is the simplest task level technique that retries the failed task on the same cloud resource [20].
- Task Resubmission-It is the most widely used fault tolerance technique in current scientific workflow systems [25]. Whenever a failed task is detected, it is resubmitted either to the same or to a different resource at runtime.
- User defined exception handling-In this user specifies the particular treatment of a task failure for workflows.
- Rescue workflow-This technique [20] allows the workflow to continue even if the task fails until it becomes impossible to move forward without catering the failed task.

2.2 Proactive Fault Tolerance

The principle of proactive fault tolerance policies is to avoid recovery from faults, errors and failures by predicting them and proactively replace the suspected components other working components. Some of the techniques which are based on these policies are Preemptive migration, Software Rejuvenation etc.

- Software Rejuvenation-It is a technique that designs the system for periodic reboots. It restarts the system with clean state [5].

- Proactive Fault Tolerance using Self-Healing- When multiple instances of an application are running on multiple virtual machines, it automatically handles failure of application instances.
- Proactive Fault Tolerance using Preemptive Migration- Preemptive Migration relies on a feedback-loop control mechanism where application is constantly monitored and analyzed.

3. Challenges of Implementing Fault Tolerance in Cloud Computing

Providing fault tolerance requires careful consideration and analysis because of their complexity, inter-dependability and the following reasons.

- There is a need to implement autonomic fault tolerance technique for multiple instances of an application running on several virtual machines [12].
- Different technologies from competing vendors of cloud infrastructure need to be integrated for establishing a reliable system [15].
- The new approach needs to be developed that integrate these fault tolerance techniques with existing workflow scheduling algorithms [14].
- A benchmark based method can be developed in cloud environment for evaluating the performances of fault tolerance component in comparison with similar ones [21].
- To ensure high reliability and availability multiple clouds computing providers with independent software stacks should be used [22] [23].
- Autonomic fault tolerance must react to synchronization among various clouds [15].

4. Tools Used For Implementing Fault Tolerance

Fault tolerance challenges and techniques have been implemented using various tools. Table 1 compares these tools based on their programming framework, environment and application type along with different fault tolerance techniques. HAProxy is used for server failover in the cloud [13]. SHelp [12] is a lightweight runtime system that can survive software failures in the framework of virtual machines. It may

also work in cloud environment for implementing check pointing. ASSURE [9] introduces rescue points for handling programmer anticipated failures. Hadoop [7] is used for data intensive applications but can also be used to implement fault tolerance

techniques in cloud environment. Amazon Elastic Compute Cloud (EC2) [8] provides a virtual computing environment to run Linux-based applications for fault tolerance.

Table 1: Tools Used To Implement Existing Fault Tolerance Techniques

<i>Fault Tolerance Techniques</i>	<i>Policies</i>	<i>System</i>	<i>Programming Framework</i>	<i>Environment</i>	<i>Fault Detected</i>	<i>Application Type</i>
Self Healing, Job Migration, Replication	Reactive/Proactive	HAProxy[13]	Java	Virtual Machine	Process/node failures	Load balancing Fault Tolerance
Check pointing	Reactive	SHelp[12]	SQL, JAVA	Virtual Machine	Application Failure	Fault tolerance
Check pointing, Retry, Self Healing	Reactive/Proactive	Assure[9]	JAVA	Virtual Machine	Host, Network Failure	Fault tolerance
Job Migration, Replication, Sguard, Resc	Reactive/Proactive	Hadoop[7]	Java, HTML, CSS	Cloud Environment	Application/ node failures	Data intensive
Replication, Sguard, Task Resubmission	Reactive/Proactive	AmazonEC2[8]	Amazon Machine Image, Amazon Map	Cloud Environment	Application/ node failures	Load balancing, fault tolerance

5. Proposed Cloud Virtualized System Architecture And Implementation

5.1 Cloud Virtualized System Architecture

A few techniques currently exist for autonomic fault tolerance in cloud environment. SHelp can survive the software faults for server applications running in virtual machine environment [12]. There is a need to implement autonomic fault tolerance in cloud environment. If any one of the servers breaks down, system should automatically redirect user requests to the backup server. So, the cloud virtualized system architecture has been proposed and implemented using HAProxy. The application availability and reliability can be maintained by using the proposed

cloud virtualized system architecture as shown in Figure 1. The server virtualized system consists of VMs (server 1 and server 2) on which an Ubuntu 10.04 OS and database application are running. Server 2 is a backup server in case of failure. HAProxy is configured on the third virtual machine to be used for fault tolerance. The availability of the servers is continuously monitored by HAProxy statistics tool on a fault tolerant server. HAProxy is running on web server to handle requests from web. When one of the servers goes down unexpectedly, connection will automatically be redirected to the other server.

Figure 1: Cloud Virtualized System Architecture

5.2 Implementation and Experimental Results

Fault tolerant system has been implemented using HAProxy and MySQL. HAProxy is used to handle

server failures in fault tolerant cloud environment. It provides a web interface for statistics known as HAProxy statistics. Implementation includes two virtual machines as web servers, server 1 and server 2

hosting Apache Tomcat 6.0.32. HAProxy software version 1.3.15.2 is configured on third virtual machine. A simple database application written in Java is installed on the web servers. Xampp for Linux Windows XP (SP2) is used to install MySQL. Data in MySQL is replicated using replication technique for local backup. Replication enables data from one MySQL database server (the master) to be replicated

to one or more MySQL database servers. Application can be accessed on any of the web server. Data consistency is also maintained through MySQL replication. The experimental results show that HAProxy can assist server applications to recover from server failures in just a few milliseconds with minimum performance overhead.

Case 1: Figure 2 shows the stats when both the servers are working and green line indicates that the servers are up.

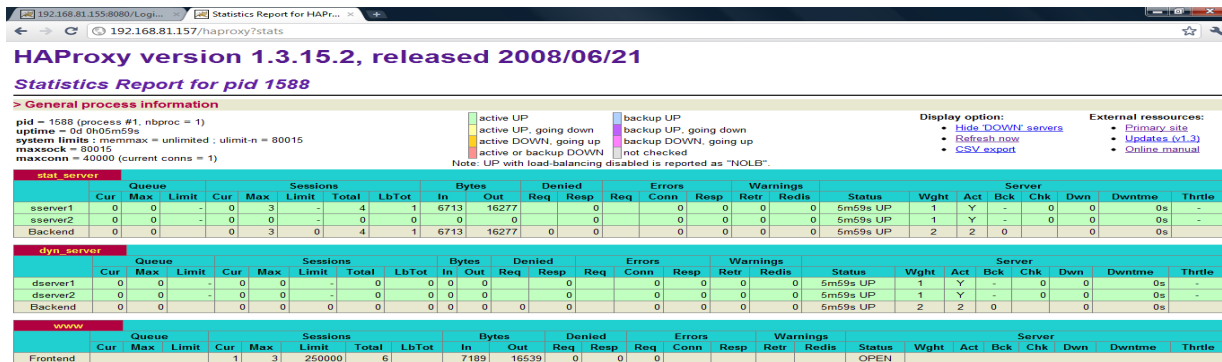

Figure 2: HAProxy Statistics

Case 2: Figure 3 shows the stats when server 1 goes down and server 2 is still up. Red line in this figure indicates that the server is down.

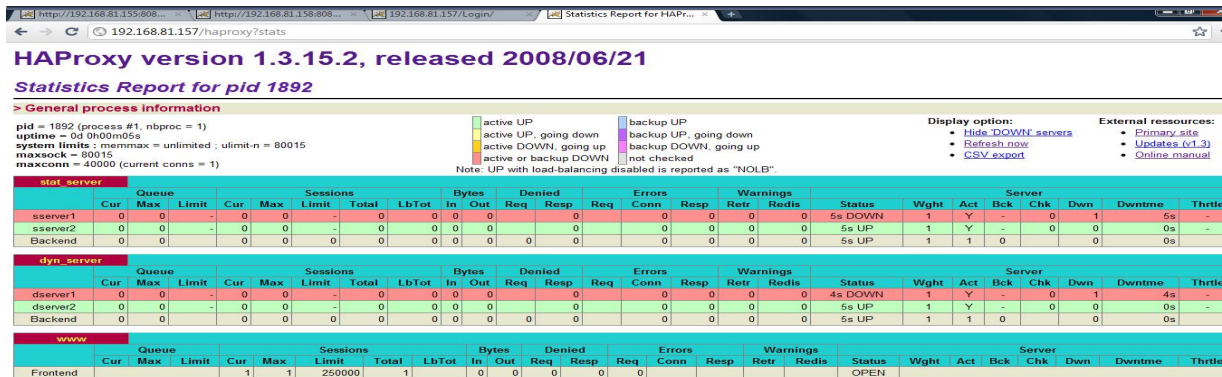

Figure3: Server 1 is down

Case 3: Figure 4 shows the stats when server 2 goes down and server 1 is still up.

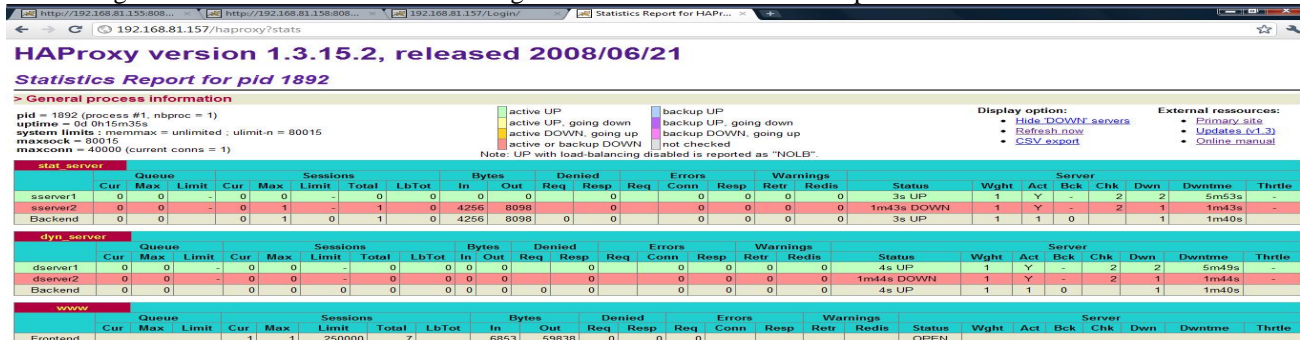

Figure 4: Server 2 is down

Case 4: Replication enables data from one MySQL database server to be replicated to one or more MySQL database servers (the slaves). Figure 5 shows the database table of server 1 using SQLyog and the connection established with server 2 slave.

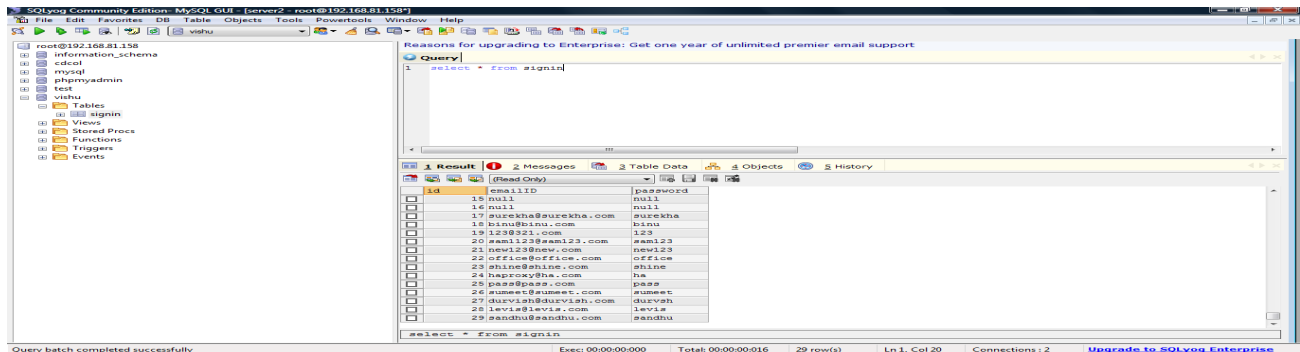

Figure 5: Database entries of sever 1

Case 5: Figure 6 shows the replicated database table of server 2. When server 1 fails data is replicated to server 2.

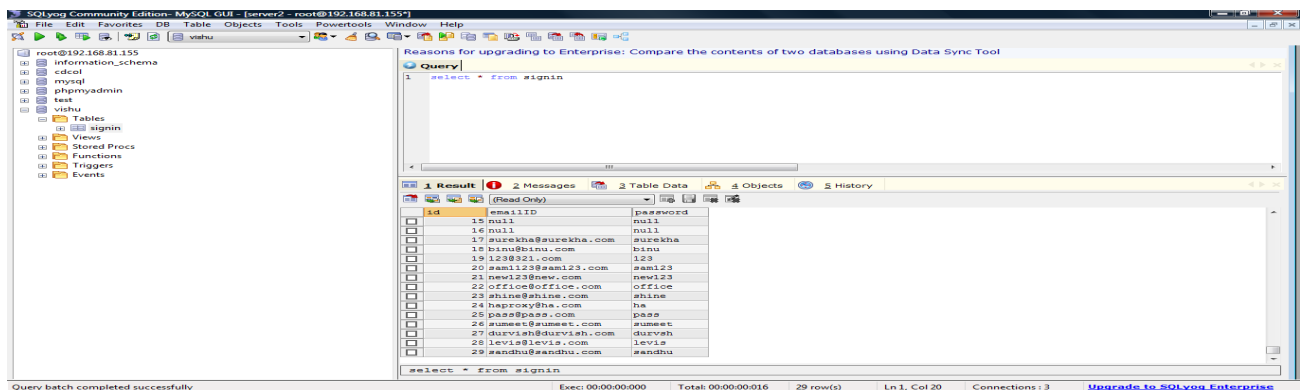

Figure 6: Replicated Database entries of sever 2

6. Conclusion

Fault tolerance is concerned with all the techniques necessary to enable a system to tolerate software faults remaining in the system after its development. This paper discussed the fault tolerance techniques covering its research challenges, tools used for implementing fault tolerance techniques in cloud computing. Cloud virtualized system architecture is

also proposed based on HAProxy. Autonomic fault tolerance is implemented dealing with various software faults for server applications in a cloud virtualized environment. When one of the servers goes down unexpectedly, connection will automatically be redirected to the other server. Data replication technique is implemented on virtual machine environment. The experimental results are obtained, that validate the system fault tolerance.

Anju Bala completed her B.Tech in Computer Science (1999) and M.Tech. in Information Technology from Pbi.University (2004) and pursuing Ph.D. in Cloud Computing from Thapar University, Patiala (2009) and has over eleven years of teaching experience. She is working as Assistant Professor in Computer Science and Engineering Department of Thapar University, Patiala. Her research interests lie in Fault Tolerance in Cloud Computing and Workflow management in Cloud Computing. She has over 14 publications in Conferences and International Journals of repute.

Dr. Inderveer Chana completed her B.Tech in Computer Science (1997) and M.E. in Software Engineering from TIET (2002) and Ph.D. in Resource Management in Grid Computing from Thapar University, Patiala (2009) and has over thirteen years of teaching and research experience. She is working as Assistant Professor in Computer Science and Engineering Department of Thapar University, Patiala. Her research interests include Grid computing, Cloud Computing and resource management challenges in Grids and Clouds. She has over 30 publications in International Journals and Conferences of repute. More than 20 Masters have been completed so far under her supervision and is currently supervising 9 Doctoral candidates in the area of Grid and Cloud Computing.
